The Human Development Index (HDI) is an important indicator used to measure a country's overall development based on health, education, and standard of living. Calculating HDI manually requires collecting and analyzing multiple socio-economic indicators, making the process time-consuming and complex.

The objective of this project is to develop a machine learning-based prediction system capable of estimating the Human Development Index using selected country-specific indicators.

### The application should:

- Predict HDI accurately using Linear Regression.
- Accept user inputs through a web interface.
- Display the predicted HDI value.
- Classify the country into the appropriate Human Development category.
- Provide quick and reliable predictions without manual calculations.
